

Thank you for purchasing a custom made BUMM. Please remember to connect your own external effector, which will be activated when the countdown reaches 0:00. We suggest using C4 as an effector for the default configuration. For other effectors, please do not hesitate to contact our sales department for different options.

Each BUMM is uniquely assembled using different control modules as per customer specification. Each control module can be activated independently and has to be defused separately, if the situation requires a restart. Defusing a single module changes the status indicator LED from red to green. You do not have to activate all modules, but it is highly suggested you do so to achieve maximum security.

**WARNING** Do not move the BUMM until all status indicators are green or off! Moving the BUMM with armed modules may result in immediate activation of the effector!

During setup, BUMM can be configured with different countdown settings and a manipulation detector (MD). The MD submodule can activate the connected BUMM effector if an unauthorized manipulation of the modules is detected. It can be configured with different sensitivities: Low sensitivities will only trigger the manipulation alert if multiple mistakes are made during defusal. As long as at least one of the MD health indicators (above the countdown timer) is lit, the MD is in safe mode. If all indicator LEDs are off, any mishandling of the modules will immediately activate the MD alert and the connected effector.

For service requests, please have your serial number ready. You can find the serial number of your BUMM visible on the outside of the BUMM. The serial number has four decimal digits followed by a single uppercase letter (e.g. 1234A).
